

Q: How can I fix a resettable combination lock that sticks from time to time?

A:

Lubricate your locks with Master Lock recommended lock lubricant 2300D and 2311. Master Lock's lock lubricant 2300D and 2311 is specially formulated to not only prevent your locks from corroding, but the formula also prevents moisture from condensing inside the lock, which greatly reduces the likelihood your lock will freeze due to cold weather.

Q: How do I set or reset the combination on a Set-Your-Own combination padlock model 175, 176, 177 or 178?

A:

To set the combination on a Set-Your-Own combination padlock model 175, 176, 177, or 178, follow these steps:

1. Open lock with the factory set or previously set combination. The lock must be set to the current combination, or you cannot reset it. Note: the shackle must be in the open position to reset the combination.
2. Insert reset tool (enclosed in package) in hole on side of lock.
3. Push reset tool in and turn 90 degrees (in either direction). Reset tool automatically stays in this position.
4. Set wheels to desired combination.
5. Turn and remove reset tool. Lock is now set to new combination.
6. Record your new combination in a safe place.
